                                                                          with
                                                                     antibacterial agent comprises contacting a ynes polypeptide (5-ynes) with the Est compound and detecting an interaction of the test compound with the S-ynes polypeptide which indicates that the compound is an antibacterial agent. Alternatively, detecting a decrease in function of the polypeptide contacted with the test compound and determining whether the compound inhibits growth of bacteria, relative to the growth of bacteria cultured in the absence of a test compound where inhibition of growth indicates the compound is an antibacterial agent. Inhibitors of S-ynes function are useful for treating a Streptococcus pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            540

The present invention describes a computer readable medium which has the nucleotide sequences SEQ ID NO:1 to 391 (AAV52134 to AAV52524)

C recorded on it, or a representative fragment or a sequence at least 954 identical to SEQ ID NO: 1 to 391. The nucleotide sequences depicted in dentical to SEQ ID NO: 1 to 391. AAV52524) are genomic fragments from SEQ ID NO: 1 to 391 (AAV52134 to AAV52524) are genomic fragments from C streptococcus pneumoniae. The present invention also describes an isolated molecule encoding a homologue of any of the cragments of the S.pneumoniae genome (SEQ ID NO: 1 to 391) where the nucleic acid molecule is produced by a process comprising: 60 screening a genomic DNA library using as a probe a target sequence defined by any cof the sequences in SEQ ID NO: 1 to 391, identifying members of the incleic acid molecules from the molecules from the earget sequence and isolating the nucleic acid molecules from an organism, amplifying nucleic acid molecules whose nucleotide sequence is homologous to amplification complexity and isolating the amplification and isolating the amplified sequences. The computer creadable medium can be used in a computer-based system for identifying computer readable medium can be used in a computer-based system for identifying computer respection modulating fragments of the S. pneumoniae genome. Products from the present invention can be used in diagnosis kits and assays, and parmaceutical compositions and vaccines for S. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         5149 ATGATTACAATAGTTTTATTAATCCTAGCCTATCTGCTGGGTTCGATTCCATCTGGTCT 5208

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential compared to genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumonlae, Fseudomonas aeruginosa and Enterococcus faccalis. The convention is also useful for the identification of potential new targets invention is also useful for the identification of potential new targets of antibiotic development. The antisense nucleic acids can also be used to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acids equence is also useful to screen for homologous nucleic acids which are required for cell proliferation in construction of a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Construction is accountable to this patent did not form part of the printed specification, but was obtained in electronic

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are Escherichia coli, Staphylococcus aucus, Salmonella typhi, Klebsiella coli stability and salso useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense nucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence encodes an essential prokaryotic cellular proliferation protein.

Con the printed specification, but was obtained in electronic format directly from WIPO at.

                                                              This sequence represents a Streptococcus pneumoniae general essential protein (GEP) gene of the invention. The genes encoding the GEP polypeptides are useful molecular tools for identifying similar genes in pathogenic microorganisms, such as pathogenic strains of Bacillus. In addition, the operons containing genes encoding GEP and the polypeptides themselves, are useful targets for identifying compounds that are inhibitors of the pathogens in which the GEP are expressed. Such inhibitors are useful for inhibiting bacterial growth by being bacteriostatic or bacteriocidal.
          Streptococcus pneumoniae general essential protein genes and proteins, useful for identification of antibacterial agents -

The invention relates to a protein (ABP25413-ABP30895) from group B

streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GBS (Streptococcus pyogenes), comprising one of 5481 sequences (S1), given in the specification. The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN66044-ABN71526 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.

Nucleic acids encoding (I) are used to detect Streptococcus in a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to determine whether a compound binds to (I). A composition comprising (I) or a nucleic acid encoding (I), may be used to recombinantly produce (I) and may be cald encoding (I) may be used to recombinantly produce (I) and may be used in gene therapp. Antibodies to (I) are used for affinity chromosography.
                                                                                                                                                                                                                              New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      AAAGGTGGTAAGGCTGTCGCAACCAGTGCTGGAGTGATTTTCGGATTTGCGCCTATCTTC 360

The proteins have antibacterial and antiinflammatory activity. (I), nucleic acids encoding (I), ABN6044 ABN71256 and antibodies that bind (I) are used in the manufacture of medicaments for the treatment or prevention of infection or disease caused by Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes. C. Nucleic acids encoding (I) are used to detect Streptococcus in a biological sample. (I) is used to determine whether a compound binds to used as a vaccine or adagnostic composition. The disease caused by Streptococcus that is prevented or treated may be meningitis. Nucleic acid encoding (I) may be used to recombinantly produce (I) and may be compated in gene therapp. Antibodies to (I) are used for affinity compatography, immunoassays, and distinguishing/identifying

The invention relates to a protein (ABP25413-ABP30895) from group B

c streptococcus/GBS (Streptococcus agalactiae) or group A streptococcus/GAS

(Streptococcus pyogenes), comprising one of 5481 sequences (S1), given in

the specification. The proteins have antibacterial and antiinflammatory

activity. (1), nucleic acids encoding (1), ABN6604-ABN71526 and

c antibodies that bind (1) are used in the manufacture of medicaments for

the treatment or prevention of infection or disease caused by

Streptococcus bacteria, particularly S. agalactiae and S. pyrogenes.

Nucleic acids encoding (1) are used to detect Streptococcus in a

cused as a vaccine or diagnostic composition. The disease caused by

Streptococcus that is prevented or treated may be meningitis. Nucleic

cused as a vaccine or diagnostic composition. The disease caused by

Streptococcus that is prevented or treated may be meningitis. Nucleic

acid encoding (1) may be used to recombinantly produce (1) and may be

cused in gene therapy. Antibodies to (1) are used for affinity

current or prevented or treated may contained may be

chromatography, immunoassays, and distinguishing/identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     6;
                                                                                                                                                                                            New Streptococcus protein for the treatment or prevention of infection or disease caused by Streptococcus bacteria, such as meningitis, and for detecting a compound that binds to the protein -

A computer readable medium has been developed which has recorded on it 982 nucleotide sequences isolated from the Enterococcus faecalis genome. AAX12938 to AAX13919 represent these nucleotide sequences which are primary nucleotide sequences, also known as contigs. The computer-based system can identify fragments of the Enterococcus faecalis genome with commercial importance. The products can be used to detect the presence of Enterococcus faecalis in samples. They can also be used for progression of disease, and for identifying agents which can be used to modulate the growth or pathogenicity of Enterococcus faecalis, or another related organism, in vivo or in vitro. In particular the polypeptides encoded by the Enterococcus faecalis nucleotide sequences can be used in vaccines to prevent or attenuate an Enterococcal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                open reading frame; ORF; bacterial infection;
                                                                                         The present invention relates to nucleic acid sequences (ABO6718-ABO71212) from Listeria sp. The sequences are useful as probes and primers for identification and/or detection of Listeria (e.g. as contaminants in foods, or mutational analysis) and for analysis of gene expression. Proteins encoded by the nucleic acid sequences can be used to screen for compounds that modulate gene expression, replication and pathogenicity of Listeria (potential therapeutic agents), also for treating infections by Listeria, and are useful as immunogens in

                                                                                                                                                                                                                                                                                                                   ABN90538 to ABN93374 represent Staphylococcus epidermidis open reading frame (ORF) nucleic acid sequences which encode the amino acid sequences given in ABP35124 to ABP37960. The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life
                                                                                                                                                                                                                                                                                                                                                                                                                     cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

This sequence represents one of 5191 Staphylococcus aureus DNA sequences of the invention. The DNA sequences are recorded on a computer readable confirm in the invention. The DNA sequences are recorded on a computer readable medium, preferably selected from a floppy or hard disk, random access can emenory (RAM), read-only memory (ROM) or CD-ROM. Homology searches using the S.aureus DNA sequences allows putative functions to be assigned so that protein-encoding or regulatory regions of commercial, therapeutic or industrial importance can be obtained. Specifically, sequences which are consecuted in a vaccine composition against S.aureus infection. The be used in a vaccine composition against S.aureus infection of S.aureus in a sample. S.aureus is implicated in numerous human diseases, including cellulitis, eyelid infections, food poisoning, osteomyelitis, skin and surgical wound infections, scalded skin syndrome, toxic shock syndrome, etc. Organisms transformed with the DNA sequences can be used for recombinant production of the polypeptides. The new DNA sequences can be used their fragments) are useful as primers or probes for isolating contains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Location/Qualifiers

AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG83120, from Staphylococcus epidermidis. (I) and (II) can have antibacterial activity and therefore can be used to in vaccination. The nucleic acids (I) may be used to produce the solidaring them which are used to produce hosts cells which express the containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) fand/or nucleic acids) may then be considered to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their activity and therefore identify compounds that may be used for the activity and therefore identify compounds that may be used for the continuity and therefore identify compounds that may be used for the polynuclectide sequences from the present invention. AAH55091 to polynuclectide sequences from the present invention. AAH55091 to AAH55098 represent oligonuclectide sequence sand primers which are used in the exemplification of the present invention.

Con the exemplification of the present invention. AAH55091 to sequence siven in the sequence listing of the present specification, however the sequence listing only goes up to SEO ID NO:4454 so even consequences are given in the disclosure for SEO ID NO:4455 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       \ddot{\boldsymbol{\cdot}}

This sequence encodes the Bacillus subtilis B-yneS protein. B-yneS is related to the Streptococcus pneumoniae general essential protein (GEP) gene of the invention. The genes encoding the GEP polypeptides are useful molecular tools for identifying similar genes in pathogenic microorganisms, such as pathogenic strains of Bacillus. In addition, the operons containing genes encoding GEP and the polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                1077 TCAATCATCATTCATGATTATATTTTACTTGCTTAGCGGAATTGTTTCAATCATATTA 1018

                                                                                                                                                                                                                                                                                                                                                                                                             ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     AAH52304 to AAH53970 represent nucleic acids (I) encoding polypeptides (II), given in AAG81454 to AAG81120, from Staphylococcus epidermidis.

(I) and (II) can have antibacterial activity and therefore can be used in vaccination. The nucleic acids (I) may be used to produce the S. epidermidis polypeptides (II) via the production of vectors containing them which are used to produce hosts cells which express the polypeptides. The polypeptides (II) fand/or nucleic acids) may then be used to vaccinate subjects and to raise antibodies against the bacteria. The polypeptides may also be used to assay for other inhibitors of their reatment of S. epidermidis infections, e.g. endocarditis. AAH53971 to AH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequences from the present invention. AHH55091 to AH55090 represent specifically claimed S. epidermidis genomic DNA polynucleotide sequence flow the present invention of the present invention. AH45591 to AH55091 to the exemplification of the present invention. AH4545091 to sequence stream the sequence listing only goes up to SEQ ID NO:4454 so even though sequences are given in the disclosure for SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472, no sequences are present for SEQ ID NO:4455 to 4472,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CCAACTAACAGTTTTCGTGTTTTGGAAGACCAGCTGGATTTATAGTTACGTTTTTAGAT 1378

Determination of this BAC-end sequence was carried out as part of
collaboration with the Berkeley Drosophila Genome Project (BDGP).
The BDGP is constructing a physical map of the Drosophila
malanogaster genome using these BACs. For further information
please see http://www.fruitfly.org The BDGP Drosophila
malanogaster BAC library was prepared by Kazutoyo Osoegawa and
Auron Mammoser in Pleter de Jong's laboratory in the Department of
Cancer Genetics at the Roswell Park Cancer Institute in Buffalo,
NY. The library is named RPCI-98 and was constructed by partial
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Drosophila melanogaster

1 (bases 1 to 1154)
EcoRI digestion of Drosophila DNA provided by the BDGP from the lasgenic strain y2; cn bw sp, the same strain used for the BDGP's P1 and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Tissue Procurement: ATCC CDA Library Library Preparation: Ling Hong/Rubin Laboratory CDNA Library Preparation: Ling Hong/Rubin Laboratory CDNA Library Arrayed by: The I.M.A.G.E.                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                (TIGN). The BAC library (ND-TAM) provided by F.H. Collins and sequenced by The Institute for Genomic Research (TIGN). The BAC library was generated from A. gambiae PEST strain DNA. All DNA was extracted from newly hatched first instar larvae to minimize the inclusion of DNA from microorganisms that inhabit the gut. The DNA is derived from mixed sexes of larvae. The BAC library was constructed at Texas AAM Universty BAC Center University, College Station, Texas 77843-2123, USA using a Hindili Seq primer: M13 For
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Loftus, B.J.

This clone is from an A. gambiae BAC library (ND-TAM) provided by
This clone is from an A. gambiae BAC library as generated from A. gambiae PEST strain
DNA. All DNA was extracted from newly hatched first instar larvae
to minimize the inclusion of DNA from microorganisms that inhabit
the gut. The DNA is derived from mixed sexes of larvae. The BAC
library was constructed at Texas AAM Universty BAC Center
University, College Station, Texas 77843-2123, USA using a HindIII
Seq primer: Mis For
Class: BAC ends.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Barkeley Drosophila Genome Project (BDGP).

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitify.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Gsoegawa and Aaron Mammoser in Pieter de Jons's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain y2; cn bw sp, the same strain used for the BDGP's pl and EST libraries. A more detailed description of the library and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

Determination of this BAC-end sequence was carried out as part of a collaboration with the Berkeley Drosophila Genome Project (BDCP). The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila nelanogaster BAC library was prepared by Kazutoyo Osoegawa and Aaron Mammosor in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RBCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDCP from the isogenic strain v2: on bw sp, the same strain used for the BDGP's and how to order individual BAC clones, the entire library or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.

The BDGP is constructing a physical map of the Drosophila melanogaster genome using these BACs. For further information please see http://www.fruitfly.org The BDGP Drosophila melanogaster BAC library was prepared by Kazutoyo Oscogawa and Aaron Mammoser in Pieter de Jong's laboratory in the Department of Cancer Genetics at the Roswell Park Cancer Institute in Buffalo, NY. The library is named RPCI-98 and was constructed by partial EcoRI digestion of Drosophila DNA provided by the BDGP from the isogenic strain v2; on bw sp, the same strain used for the BDGP's and how to order individual BAC clones, the entire library, or filters for hybridization from the BACPAC Resource Center can be found at http://bacpac.med.buffalo.edu/drosophila_bac.htm.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1, Ap Sequence 2, Ap Sequence 3, Ap Sequence 3, Ap Sequence 10, Ap Sequence 24, Ap Sequence 1, Ap Sequence 2, Ap Sequence 628, Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 64, Ap Sequence 6
